MI AMOR Tales

Website handover.

Everything needed to own, update, publish, protect, and grow the Mi Amor Tales website.

PREPARED 5 OCTOBER 2026

VERSION F30FE6C

START HERE

The website in one page.

Mi Amor Tales is a custom, code-managed portfolio website. It is fast and flexible, but it does not have an admin dashboard. Content changes are made in the project files, checked locally, and published through GitHub and Vercel.

LIVE WEBSITE

www.miamortales.com

The root domain redirects to www.

HOSTING

Vercel

The site and DNS are served by Vercel.

SOURCE CODE

GitHub

`github.com/varpar/MAT`, branch `main`.

FRAMEWORK

Next.js 16

React 19, TypeScript, local media.

Current production baseline

This guide documents commit `f30fe6c11262125c011224648c9b8633259ebb1e` , "Complete featured films and enquiry flow". Local and remote `main` matched when this guide was prepared.

PUBLIC PAGES

Home, Featured, Weddings, About, Tales, Contact

FEATURED STORIES

Six couples

Each has its own story, gallery, rituals, and moving hero.

ENQUIRIES

WhatsApp

The form prepares a message. It does not email or store leads.

CONTENTS

Find the answer quickly.

01 Accounts and ownership

02 Hosting and domains

03 How the site is organised

04 Common content changes

05 Featured couples and stories

06 Photos and films

07 Contact form and details

08 Run the site locally

09 Publish and roll back

10 Release checklist

11 Maintenance and troubleshooting

12 Update this guide

Who should read what

Sections 1-3 explain ownership in plain language. Sections 4-12 are the working manual for the maintainer or developer.

01 / OWNERSHIP

Accounts the client must control.

A handover is complete only when Mi Amor Tales controls the code, hosting, domain, and original media. Never write passwords in this guide or commit them to GitHub.

ASSET	CURRENT REFERENCE	HANDOVER ACTION	STATUS
Domain	`miamortales.com`	Confirm registrar owner, billing, recovery email, and two-factor authentication.	CONFIRM
Hosting	Vercel	Invite the client as owner/admin of the production project. Confirm billing and alerts.	TRANSFER
Source code	`github.com/varpar/MAT`	Add the client and future maintainer. Protect `main`.	TRANSFER
Source media	Client Google Drive	Keep original photographs, films, magazine copy, and usage permissions in a client-owned archive.	CONFIRM
Business email	`hello@miamortales.com`	Confirm mailbox ownership, renewal, recovery, and spam protection.	CONFIRM
Cloudinary	Optional utility	Keys in `.env.example` are for migration scripts. Current public images are local.	OPTIONAL

Recommended access model

- Mi Amor Tales owns every primary account and keeps two recovery contacts.
- The developer receives collaborator access, not the client's password.
- Enable two-factor authentication everywhere and store recovery codes in a client-owned password manager.
- Remove former collaborators when their work ends.

> **Keep secrets out of GitHub**
>
> Real `.env` files are ignored. API keys, registrar passwords, email passwords, and Vercel tokens belong in account settings or a password manager.

02 / HOSTING

Where the website lives.

The public site is hosted on Vercel. The custom domain points to Vercel, and the root domain redirects to the www address.

PRIMARY ADDRESS

https://www.miamortales.com

Use this in profiles, QR codes, and client communication.

TECHNICAL FALLBACK

https://mat-bay.vercel.app

Keep as a deployment URL, not the public brand address.

Verified behaviour

- `https://miamortales.com` redirects to `https://www.miamortales.com/`.
- `www.miamortales.com` resolves through `cname.vercel-dns.com`.
- The live response identifies Vercel as the server and uses HTTPS with HSTS.

Final transfer checklist

1. Open Vercel and identify the project serving the custom domain.
2. Confirm its Git repository is `varpar/MAT` and production branch is `main`.
3. Invite the client's Vercel account as owner/admin.
4. Confirm both root and www domains are attached.
5. Move renewal, billing, and failure notifications to client-controlled addresses.

> **Do not create a duplicate Vercel project**
>
> The local `.vercel` folder is ignored. A maintainer using the CLI must run `npx vercel link` and select the existing production project.

03 / STRUCTURE

How the site is organised.

Page copy and layouts live in page components. Shared wedding data, image records, stories, and featured couple settings live in one central data file. This is a code-managed website, not a WordPress, Webflow, CMS, or database project.

AREA	PRIMARY LOCATION	CONTROLS
Homepage	`app/_pages/HomeClient.tsx`	Hero, marquee, six couples, featured film, editorial sections, and CTA.
Featured index	`app/_pages/FeaturedIndexClient.tsx`	Featured landing page and cards.
Couple pages	`app/_pages/FeaturedStoryClient.tsx`	Story layout, chapters, gallery, venue story, and ending.
Wedding data	`app/_components/data.ts`	Image records, stories, featured list, videos, and ritual assignments.
Story schema	`app/_lib/featured-story.ts`	Required story fields, rituals, vendor credits, and extras.
Weddings archive	`app/_pages/WeddingsClient.tsx`	Archive grid, categories, ratios, and selected records.
Tales	`app/_pages/TalesClient.tsx`	Stories, album previews, filters, and introductions.
About	`app/_pages/AboutClient.tsx`	Studio story, stats, team, roles, and crop settings.
Contact	`app/_pages/ContactClient.tsx`	WhatsApp flow, fields, details, and FAQs.
Navigation / footer	`app/_components/Nav.tsx` `app/_components/Footer.tsx`	Menus, business details, social labels, and copyright.
Brand system	`app/_components/tokens.ts` `app/globals.css`	Colour, type, spacing, image gaps, and global behaviour.
Metadata	`app/layout.tsx and app/**/page.tsx`	Browser titles and search descriptions.
Media	`public/brand, public/images, public/home, public/video`	Logos, photographs, portraits, films, loops, and posters.

Route map

```
/                       Homepage
/featured               Featured weddings
/featured/[couple-slug] One couple's story
/weddings               Wedding archive
/tales                  Stories and albums
/about                  Studio, stats, and team
/contact                Enquiry form and FAQs
```

04 / EDITING

Common content changes.

Homepage hero photograph

1. Prepare a strong landscape JPEG with the subject safe in the centre crop.
2. Replace `public/home/hero-aks09773.jpg` using the same filename.
3. If the filename changes, update `HERO_IMAGE.publicId` near the top of `HomeClient.tsx`.
4. Check desktop and phone crops.

About copy and statistics

- The story and "The Art of Noticing" copy are in `AboutClient.tsx`.
- The `stats` array currently shows 2+ Years, 50+ Weddings, 10+ Cities, and 4-5 Awards.
- Update related homepage and footer wording when a milestone changes.

Team member

1. Add or replace the portrait in `public/images/team`.
2. Add or update its image record in `data.ts`.
3. Edit the `team` array in `AboutClient.tsx`.
4. Use optional crop settings only for small source-image corrections.

Homepage featured film

The homepage currently prefers slug `riya-sang-mohit` inside `HomeVideoSection`. Change that slug only after the replacement couple has a valid `heroVideo`.

Menu and footer

Edit `NAV_LINKS` in `Nav.tsx`. Edit business details and footer labels in `Footer.tsx`. Keep route paths unchanged unless the route itself is changed.

05 / COUPLES

Add or update a featured wedding.

Every featured page must use that couple's own photographs. Hide a ceremony when there is no verified image. Never fill a gap with another couple's photograph. Keep public slugs stable; changing one breaks saved links and search results unless a redirect is added.

COUPLE	SLUG	HERO MEDIA
Anvesha and Omkar	`anvesha-sang-omkar`	13-second silent photo film
Pooja and Harsh	`harsh-sang-pooja`	4:20 film with sound
Riya and Mohit	`riya-sang-mohit`	3:30 film with sound
Joyeeta and Harsh	`harsh-sang-joyeeta`	13-second silent photo film
Aishwarya and Shubham	`shubham-sang-aishwarya`	13-second silent photo film
Vanya and Varun	`varun-sang-vanya`	13-second silent photo film

Update an existing couple

1. Put new files in that couple's folder under `public/images`.
2. Create or update matching image records in `data.ts`.
3. Update the story object: cover copy, date, detail line, photo slots, sections, quote, vendors, ritual extras, hidden rituals, and extras.
4. Check the couple entry in the exported `FEATURED` array.
5. Inspect the story route, Featured index, homepage, and Tales.

Add a new couple

1. Create a lowercase folder and stable slug.
2. Prepare verified photos and optional film.
3. Add image records and typed story.
4. Add entry to `FEATURED`.
5. Build, inspect, and publish.

```
{
  bride: "Bride", groom: "Groom", place: "Venue, City",
  img: NEW_STORY.photos.hero,
  slug: "bride-sang-groom", story: NEW_STORY,
  heroVideo: { src, poster, duration: "2:45" }
}
```

06 / MEDIA

Photos and films that stay fast.

Use fewer, stronger frames. Every image must belong to the named couple and ceremony.

EDITORIAL MEDIA RULE

Photographs

- Use JPEG or WebP in sRGB. Recommended long edge: 2000-3000 pixels.
- Aim for roughly 300 KB-1.5 MB after optimization while preserving full-screen quality.
- Hero and poster images should be landscape; team and bridal portraits should be vertical.
- Use lowercase, descriptive, hyphenated filenames without spaces.
- Keep original full-resolution files in the client Drive. GitHub holds delivery copies.

Films

- Use MP4 with H.264 video and AAC audio, normally 1920 x 1080 landscape.
- Enable fast start and aim below 50 MB. GitHub blocks normal files at 100 MB.
- Supply a poster JPEG for full films.
- Set `withSound: false` for silent montages so the interface says "Photo film" and hides sound controls.

Folder pattern

```
public/images/couple-slug/
  hero.jpg, bride.jpg, groom.jpg
  storyImage1.jpg, storyImage2.jpg
  haldi.jpg, mehendi.jpg, sangeet.jpg
  pheras.jpg, vidaai.jpg, intimateBW.jpg
  closing.jpg, extra1.jpg ...

public/video/featured/couple-slug/
  highlight.mp4
  poster.jpg
```

Next.js creates AVIF and WebP variants in production, but source files still need sensible dimensions and compression.

07 / ENQUIRIES

Contact details and WhatsApp.

The enquiry form runs in the browser. It builds a readable message from the fields and opens WhatsApp to the studio number.

WHATSAPP DESTINATION

+91 99284 12112

Stored as `WHATSAPP_NUMBER = "919928412112"`.

DISPLAYED EMAIL

hello@miamortales.com

Shown on Contact and in the footer. It is not the form destination.

What submit does

1. Checks the required name and email fields.
2. Builds a message with names, email, phone, date, venue, package, and notes.
3. Opens WhatsApp or WhatsApp Web with the message ready to review.
4. Sends only when the visitor presses Send inside WhatsApp.

> **No lead database or automatic email**
>
> The site does not save submissions, send notification emails, or maintain an enquiry dashboard. Add a verified backend and privacy disclosure before collecting data.

Change the WhatsApp number

1. Edit `WHATSAPP_NUMBER` in `ContactClient.tsx`, digits only with country code.
2. Update the formatted number lower in that file.
3. Update `Footer.tsx`.
4. Test on phone and desktop.

FAQs and social links

Edit `FAQS` near the top of `ContactClient.tsx`. Footer social names currently have no external URLs; adding real links requires editing `Footer.tsx`.

08 / LOCAL SETUP

Run the website on a computer.

Requirements

- Git
- Node.js 20.9.0 or newer
- npm
- GitHub repository access

First setup

```
git clone https://github.com/varpar/MAT.git
cd MAT
npm ci
npm run dev
```

Open `http://localhost:3000`.

Before editing

```
git checkout main
git pull origin main
npm ci
```

Before publishing

```
npm run lint
npm run build
```

> **Environment variables**
>
> Normal viewing needs no Cloudinary credentials because current images are under `public`. Keys in `.env.example` are for optional migration scripts. Never commit a real `.env`.

09 / PUBLISHING

From edit to live website.

DRAFT	REVIEW	TEST	APPROVE	VERIFY
Make one focused change on a branch.	Check copy, identity, crops, and links.	Run lint and production build.	Merge the approved change to `main`.	Wait for Vercel, then test live.

Recommended Git workflow

```
git checkout -b content/update-name
# make and test the change
git add -A
git commit -m "Update featured wedding gallery"
git push -u origin content/update-name
```

Open a pull request, review the preview deployment, and merge into `main`. Direct pushes should be limited to trusted maintainers and small approved changes.

Live verification

- Vercel marks production Ready.
- The custom domain shows the new revision.
- All main pages load.
- The changed page works on phone and desktop.
- Images, films, navigation, and WhatsApp work.

Rollback

Fast: promote the last known-good deployment in Vercel. **Permanent:**

```
git log --oneline
git revert BAD_COMMIT_SHA
git push origin main
```

> **Preserve history**
>
> Do not force-push or use `git reset --hard` as a production release strategy. A revert is reviewable and recoverable.

Check before every release.

Content and identity

- [ ] Names and spellings are correct.
- [ ] Every photo belongs to the named couple.
- [ ] Ceremony labels match the visible event.
- [ ] No image repeats unintentionally.
- [ ] Venue, date, stats, email, and phone are current.
- [ ] Stories have client approval.

Visual and functional

- [ ] No overlap or clipped text on phone, tablet, or desktop.
- [ ] Hero subjects crop correctly.
- [ ] Spacing remains intentional.
- [ ] Films and posters are correct.
- [ ] Navigation, filters, lightbox, and form work.
- [ ] Keyboard focus and reduced motion remain usable.

Technical checks

```
npm run lint
npm run build
git diff --check
```

Routes to open

```
/
/featured
/featured/anvesha-sang-omkar
/featured/harsh-sang-pooja
/featured/riya-sang-mohit
/featured/harsh-sang-joyeeta
/featured/shubham-sang-aishwarya
/featured/varun-sang-vanya
/weddings
/tales
/about
/contact
```

> **Preview before production**
>
> Use a Vercel preview deployment for client approval whenever a visual change is substantial.

11 / CARE

Maintenance and troubleshooting.

Monthly

- Open all main pages and prepare a test WhatsApp enquiry without sending.
- Check domain, HTTPS, failed deployments, and bandwidth.
- Confirm approved work exists in GitHub and source media exists in the client archive.

Quarterly

- Review dependency updates on a separate branch.
- Run mobile performance and accessibility checks.
- Audit team, statistics, details, FAQs, social links, and availability language.
- Confirm GitHub recovery and backups.

Common problems

PROBLEM	LIKELY CAUSE	FIRST ACTION
Old content is live	Build pending, wrong branch, or cache	Check Vercel production commit, then hard-refresh.
Image is missing	Wrong filename, case, or record path	Confirm exact file and matching `publicId`.
Video does not play	Encoding, size, or path	Check H.264/AAC MP4, file path, poster, and browser console.
Wrong event photo	Story slot or ritual extras	Fix the couple story in `data.ts` or hide the ritual.
Wrong WhatsApp number	Values are out of sync	Update Contact and Footer, then test both devices.
Build fails	Syntax, type, import, or missing asset	Fix the first build error locally before publishing.
Domain fails	DNS, renewal, Vercel domain, or billing	Check registrar, Vercel Domains, records, and project owner.

Known improvements

- Add real URLs to footer social labels.
- Add a lead backend only if enquiry tracking is required.
- Set explicit production `metadataBase` for absolute social previews.
- Review unused story data before removing it.
- Protect `main` with required checks and review.

Update and export this handover.

The editable source is this HTML file. It contains its layout and print styles and uses the website's local logo, font, and photographs.

Editable source

`handover/mi-amor-tales-website-handover.html`

Update process

1. Edit the HTML in a code editor.
2. Open it in Chrome and review wide and narrow layouts.
3. Run `node handover/export-handover.mjs` from the project root.
4. Inspect every PDF page for clipping, overlap, missing images, or blanks.
5. Update the cover date and version for every major handover revision.

Update this guide when these change

- URLs, account owners, repository, branch, or deployment flow.
- Featured couples and film types.
- Phone, email, social links, statistics, or team.
- Content locations, scripts, services, environment variables, or maintenance tasks.
- The production commit shown on the cover.

> **Definition of done**
>
> The client can access every account, a new developer can run and publish the site, content locations are clear, domain and billing are client-controlled, and a tested rollback path exists.
